

INSTALLATION INSTRUCTIONS

CHASSIS SKID PLATE

Installation of the skid plate kit is fairly straightforward. Three plates are provided, with typical installations using one on each side of the "waist" area of the kart, and one on the front frame member. The photo to the right shows a typical installation (on a kart that was lacking protection). You can locate the plates anywhere you feel they will provide the best frame protection, or order additional plates for even more protection. For best results, install the kit on a new chassis to protect your investment. The purpose of the plates is to wear out, rather than the expensive kart chassis, so replacing the plates on a regular basis is important to maximize the protection.

STEP 1

Locate the plates on the underside of the kart, where the bolt hardware will have adequate clearance on the top side, and the plates will provide the best protection. Mark two mounting holes for each plate on the floor pan.

STEP 2

Drill 1/4" holes through the aluminum floorpan, being careful not to damage anything when breaking through.

STEP 3

Install plates on the underside of the kart using the included 6mm bolts, locking nuts, and washers, as shown in picture.

Make sure the plates are securely fastened and you're done!
